nRF24L01 Pin Configuration

Pin Number	Pin Name	Abbreviation	Function
1	Ground	Ground	Connected to the Ground of the system
2	Vcc	Power	Powers the module using 3.3V
3	CE	Chip Enable	Used to enable SPI communication
4	CSN	Ship Select Not	This pin has to be kept high always, else it will disable the SPI

5	SCK	Serial Clock	Provides the clock pulse using which the SPI communication works
6	MOSI	Master Out Slave In	Connected to MOSI pin of MCU, for the module to receive data from the MCU
7	MISO	Master In Slave Out	Connected to MISO pin of MCU, for the module to send data from the MCU
8	IRQ	Interrupt	It is an active low pin and is used only if interrupt is required

nRF24L01 Features

**38
Likes**

- 2.4GHz RF transceiver Module
- Operating Voltage: 3.3V
- Nominal current: 50mA
- Range : 50 – 200 feet
- Operating current: 250mA (maximum)
- Communication Protocol: SPI
- Baud Rate: 250 kbps - 2 Mbps.
- Channel Range: 125
- Maximum Pipelines/node : 6
- Low cost wireless solution

Note: Complete Technical Details can be found at the **NRF24L01 datasheet** given at the end of this page.

Other RF modules

HC12, 433MhZ RF Module (https://components101.com/433-mhz-rf-transmitter-module), nRF905

Other Wireless Options

Bluetooth (https://components101.com/wireless/hc-05-bluetooth-module), Lora, ESP8266 (https://components101.com/wireless/esp8266-pinout-configuration-features-datasheet), GSM, Xbee

Brief Description on NRF24L01

The n**RF24L01 is a wireless transceiver module**, meaning each module can both send as well as receive data. They operate in the frequency of 2.4GHz, which falls under the ISM band and hence it is legal to use in

almost all countries for engineering applications. The modules when operated efficiently can cover a distance of 100 meters (200 feet) which makes it a great choice for all wireless remote controlled projects.

The module operates at 3.3V hence can be easily used with 3.2V systems or 5V systems. Each module has an address range of 125 and each module can communicate with 6 other modules hence it is possible to have multiple wireless units communicating with each other in a particular area. Hence mesh networks or other types of networks are possible using this module. So if you are looking for a wireless module with the above properties then this module would be an ideal choice for you.

How to Use the NRF24L01

The **NRF24L01 module** works with the help of **SPI communications**. These modules can either be used with a 3.3V microcontroller or a 5V microcontroller but it should have an SPI port. The complete details on how to use the module through SPI is given the data sheet below. The circuit diagram shows how the module should be interfaced with a microcontroller.

Here I have shown how for a 3.3V microcontroller, but it applies the same for a 5V MCU as well. The SPI Pins (MISO<MOSI and SCK) are connected to the SPI pins of the Microcontroller and the signal pins (CE and CSN) are connected to the GPIO pins of the MCU.

If you are interfacing the module with Arduino (https://components101.com/microcontrollers/arduino-uno), then there are ready made libraries available like the R24 Library (https://arduino-info.wikispaces.com /Nrf24L01-2.4GHz-HowTo#lib). With the help of these libraries you can easily interface the n**RF24L01 with Arduino** with few lines of code. If you are using for some other microcontroller then you have to read through the datasheet to understand how to establish the SPI communication.

The **nRF24L01 module** is a bit tricky to use especially since there are many cloned versions in the market. If you are having any problem with getting it work, try adding a 10uF and 0.1uF capacitor (https://components101.com/electrolytic-capacitor-pinout-datasheet) in parallel to the Vcc and Ground pins. Also make sure the 3.3V supply is clean and does not have any noise coupled in it.

Applications

- Wireless Control application
- Mesh Networks
- RF Remote Controllers
- Connected devices
